About RXFP2

Relaxin/insulin-like family peptide receptor 2, also known as RXFP2, is a human G-protein coupled receptor. It is mapped to 13q13.1. This gene encodes a member of the GPCR (G protein-coupled, 7-transmembrane receptor) family. Mutations in this gene are associated with cryptorchidism. Alternatively spliced transcript variants encoding different isoforms have been found for this gene.
